

Spiked CMS & AI Platform: End-to-End User Guide

Version: 1.0

Date: December 2025

Status: Draft

1. Introduction

This system is built on **SvelteKit** and **MongoDB**, integrated with **Google Gemini 2.5 Flash** for high-speed generative capabilities.

2. Accessing the Admin Panel

Login

The entry point to the system is protected by a secure authentication layer.

1. **Navigate to:** /admin/login
2. **Interface:** You will see a “Spiked Admin” login screen featuring glassmorphism effects and animated background orbs.
3. **Credentials:** Enter the secure passcode defined in your environment variables.

[Screenshot: Admin Login Screen]

Check verification: Login screen should show “SPIKED ADMIN” with red/purple branding.

Dashboard

Upon successful login, you are redirected to the **Dashboard**, giving you a high-level view of your Content Models.

3. Feature: AI Schema Architect

Instead of manually defining database fields, Spiked CMS uses AI to architect your content models.

Step-by-Step Guide

- 1. Navigate to **Content Models** (/admin/models).
- 2. Click the “**Generate Schema with AI**” button in the top right.
- 3. A modal window titled “AI Schema Architect” will appear.

The Prompt

In the text area, describe the content you want to store.

Example Prompt: > “Create a ‘Case Study’ model. It should have a client name, a hero image, a summary of results, a ‘Challenge’ section, a ‘Solution’ section, and a ‘Results’ section with percentage metrics.”

What happens next? 1. The system sends this prompt to Gemini 2.5 Flash. 2. The AI infers the necessary fields (e.g., **text** for Client Name, **image** for Hero Image, **richtext** for Solution). 3. A new Content Model is automatically created in MongoDB.

4. Feature: AI Content Generation

Once you have a model, you can populate it with content using the specialized AI Content Generator.

Step-by-Step Guide

1. Navigate to **Entries** (/admin/entries/[model-slug]).
2. Click the “**Generate with AI**” button.
3. The “AI Content Generator” modal appears.

The Prompt

Enter a high-level directive for the content you want to write.

Example Prompt: > “Write a breaking news story about a new AI chip from Nvidia that accelerates sales forecasting by 500x. Write it in a dramatic, ‘Wall Street Journal’ style.”

Behind the Scenes (The Logic)

The system executes a sophisticated prompt chain: 1. **Schema Awareness:** It reads the Content Model (e.g., knows there is a ‘Title’, ‘Body’, ‘Date’, ‘Image’ field). 2. **Date Enforcement:** It forces ISO-8601 formatting (YYYY-MM-DD) for compatibility. 3. **Image Strategy:** It inserts validity-checked placeholder URLs: * *Unsplash Source:* <https://images.unsplash.com/...> * *Placeholder.co:* <https://placeholder.co/800x400> 4. **Rich Text:** It generates widespread HTML/JSON structure compatible with the Tiptap editor.

Result: A fully formed “Draft” entry appears in your list instantly.

5. Editor & Publishing

The Tiptap Editor

Click on any entry to open the **Editor**. * **Rich Text:** Supports Bold, Italic, H1-H3, Lists. * **Media:** Images render with previews. * **Saving:** * **Save Draft:** Saves changes without publishing. * **Publish:** Sets status to ‘Live’, making it visible on the public blog.

6. The “Newspaper Strip” Blog Layout

Public-facing content relies on a unique design system inspired by classic broadsheets tailored for the digital age.

- **URL:** /blog/[slug]
 - **Visuals:**
 - Centered “Strip” layout on a #f4f1ea (off-white) background.
 - **Typography:** Serif fonts for body text, drop-caps for the first letter.
 - **Justification:** Text is justified for that dense, newspaper column feel.
 - **Header:** Dynamically generated “Vol. 2025” and date lines.
-

7. Future Roadmap: Newsletter System

We are preparing to expand Spiked CMS to include a **Newsletter Engine**.

Context

The goal is to repurpose our AI-generated blog content into email campaigns without leaving the platform.

Planned Workflow

1. **Audience Management:** New ‘Subscriber’ Content Model.
2. **Campaign Builder:**
 - Select existing Blog Posts.
 - **AI Summary:** “Summarize this post for an email subject line.”
 - **Template:** A clean, text-first email template matching the “Newspaper” aesthetic.
3. **Sending Infrastructure:** Integration with standard SMTP or transactional API (e.g., Resend or SendGrid).

Preparation Steps (For Developers)

- ☐ Create `Newsletter` and `Subscriber` schemas.
 - ☐ Add `is_newsletter_ready` boolean to the `Blog Post` model.
 - ☐ Research `svelte-email` for template rendering.
-

8. Change Management & Iteration

As we roll out features, we follow this improved iteration cycle:

1. **Request:** User identifies a gap (e.g., “I need to schedule posts”).
2. **Spec:** Create a brief `.md` plan in the codebase.
3. **Prototype:** Implement in a feature branch or isolated route.
4. **Audit:** Run security and performance checks (as performed for the Admin Auth system).

Security Note: All Admin actions (`create`, `update`, `delete`, `generate`) are protected by server-side session cookies. Ensure `ADMIN_PASSWORD` and `GEMINI_API_KEY` are rotated periodically in your `.env`.
